

If humanity does not detach itself from its illusory thinking of its very confused and generalized faith and become more sensible, like not seizing the opportunity that still exists to finally see, understand and judge everything according to its correctness, then it will not be able to avoid taking upon itself that which inexorably leads to misery and unhappiness; thus into the most serious crisis of its existence!

This is because 'artificial intelligence' technology will intervene in the history of humanity in such a manner – the beginning of which has already taken place – that in future it will influence the comprehension of logic as well as the senses of understanding and reason in such a negative manner that human beings will unlearn all the values of life for themselves. They are already so criminally disregarding reality that they are atrophying in their faith-based illusory thinking and in their AI-controlled illusory thoughts and behaviour, which will become much worse in the future than it already is at present as a result of being directed by constantly evolving technology. Artificial intelligence, which is already rapidly becoming dangerous for human beings, will dominate and subjugate them with such Gewalt [‘using all available coercing means and powers, in order to carry out and wield monstrous (immense/tremendous) actions and deeds.’] in the future that they will have to learn to fight for their selfhood, which they will not yet realize, but only when it is too late to free themselves from the rule of AI without a fight, when it is openly directed against them.

In order to better categorize and understand this and its significance, it helps to take a look at the fact that humanity has developed far too quickly in terms of technology, and has allowed itself to be taken in by artificial intelligence. As a result, human beings are already dominated by it and can no longer achieve anything without making use of it and calling on it for help in this or that respect.

We 'old timers' and our parents, and of course also our ancestors, were still strongly connected to nature and sometimes even integrated into it, so to speak, because we were still working in it or with it. We had earned our daily bread all those years through and with it – and the whole environment, which we often had to face fiercely – with hard labor. But we were content, and very few of us had any idea – as our ancestors also did not – that everything and all of life would change in the future to such an extent that practically everything old would be forgotten. This in the sense that, as a result of very rapid development, new things would be brought up to date and brought into line with the latest state of progress, as is happening today in our time and is appropriate, modern, new, novel, new-fangled and new-fashioned, and is described as contemporary, timely and cutting-edge.

Well, we were gifted with many abilities, but then in the new age, new talents were found in us through development, which brought forth new cognitive abilities and revolutionized us in a manner so that we could adapt to the new age. This, while the later generations moved on from the old and aspired to completely different ways of life and live in them today without even thinking about what we prepared for them in terms of all the necessities of life. Through our efforts, the Neolithic resp. first emergence of the productive economy was brought into being, which unfortunately contributed to overpopulation over the years, as this inevitably led to more and more life security as a result of the steady easing of life and advances in medicine, and consequently also to the desire for more offspring and consequently also to the fulfillment of the desire to have children. Furthermore, our efforts also brought about coexistence, the modernization of agriculture, market gardening and thus again nutrition, as well as the entire food industry, factories of all kinds and thus the industrial revolution, as well as mechanization and standardization. This also led to the emergence of more and more sports for human beings, which quickly became commercialized, and many human beings became fanatically addicted to sports, which meant that real self-activity and self-development fell by the wayside. Inevitably, many exercise machines were invented to strengthen the body and muscles, etc., while at the same time the development of technology progressed and evolved to such an extent that human beings became dependent on it. However, this was followed in the same step by the digital revolution, which led to the

development of television and, to date, the internet and devices for analyzing and controlling the nerves and sensory organs, as well as now also 'artificial intelligence', in short AI, which is already beginning to dominate human beings – without them being aware of it. However, the first stages of AI were already being developed secretly in America in the mid-1980s and were secretly deployed in 1988. In addition, AI means that many human beings become unemployed, which also leads to an increase in crime, hostility and hatred among human beings, as well as to war, dissatisfaction and a further increase in overpopulation and the total destruction and annihilation of otherwise already impaired natural areas. This will also be accompanied by the extinction of many genera and species of fauna and flora, far exceeding the current annual extinction of around 60,000 genera and species of animals, creatures and other self-propelled life-forms, as well as the plant world from the lowest mold to moss and grass to the mightiest trees.

Humanity will be dominated by Artificial Intelligence and its new concept, breaking free of all natural boundaries, and overpopulation will begin to curse at itself for not containing itself and letting Artificial Intelligence rule.

The personal physical performance of human beings will decline more and more and will be replaced by locomotion devices, just as everything and anything will also be driven by mechanical devices and machines. Human strength will no longer be in demand, and the increasingly scarce fields will be harvested by electronic types of AI, which will feed the overflowing overpopulation, at least as long as the AI can still be directed by human beings and does not yet become independent. This Earth's humanity, now numbering almost 10 billion people [9.44 billion in 2024], is sliding into a future that will be directed and governed by AI to its great disadvantage, whereby human beings will no longer be able to speak of their own manual labor or also of self-actuated mental labor, or of their own muscular and nervous activity. When human beings used to work and most of them could still read and write, in the end everything will be reversed, just as it was before the advent of modern technology and, due to rapid and uncontrolled development, artificial intelligence will also emerge, which will inevitably take over. What has been evident for some years now is that hardly any human beings can do without a 'mobile phone' or a hand-held telephone, whereby 'important' and generally irrelevant and pointless conversations or chatter are carried on and time is simply 'killed'.

If I now turn to the digital revolution, namely artificial intelligence, then it should be explained that this is mainly referring to the technical infrastructure of human cognitive abilities, which is still being replaced by computer technology and the use of countless devices, systems and machines, etc. This saves a huge amount of time and effort. This greatly and extensively spares the human being's muscular strength with regard to a great deal of work, which, however, has the consequence that this atrophies more and more, whereby the sensory system and his/her brain are also increasingly affected in this respect. The part of his/her consciousness that he/she is able to control through the functions of his/her brain is also impaired. The life energy of the Creation, which forms, animates and functions consciousness, is blocked by human beings' illusory thinking in such a manner that it can no longer be fully active in the development of the evolution of knowledge, but only partially. As a result, human beings atrophy in their self-control of their ability to evolve and become, so to speak, a 'soulless' robot that is directed and controlled from the outside, trapped in the vicious circle of a worldly belief that artificial intelligence will make everything good for them. However, this will make human beings dependent on it and enslave them, because the qualities and therefore also the performance of AI will continue to increase and will one day become so high in terms of quantity and ultimately to such an extent that everything and anything that human beings used to do will be completely forgotten, just as they will no longer be able to do anything with their own senses, energy and strength. He/She will then practically eclipse himself/herself and might become useless, just as the donkey was once replaced as a beast of burden by modern machines and trucks with 100 or 1,000 times greater carrying capacity.

Human beings have long since become accustomed to the fact that they can be outperformed by a

machine in every respect, that a machine can calculate much faster than they can. And also that a machine can already do many things better than the best of its peers. However, with artificial intelligence, it is no longer just a question of controlling everything by machine execution of pre-programmed commands, but much more. AI is specifically about the programming of learning and the categorization of what has been programmed, but also particularly about the conclusions drawn from this, with pattern recognition playing a very important role. Especially with regard to conclusions, AI will go far beyond what human beings thought in their low intelligence, namely that they were great and good at it – but have always failed miserably in this respect.

For many years now, many small 'auxiliary functions' have been creeping into human beings' everyday lives and the workings of their aspirations, opinions and wills, leading to political consequences worldwide and to war, crime, criminality, murder and manslaughter as well as to the bankruptcy and ruin of banks, companies and corporations, but also to over-indebtedness and 'lumpiness' on a private basis. This occurs when there is an unlimited inability to pay and the situation is such that current bills can no longer be paid. Lying, fraud and other dishonesty and embezzlement at banks, companies, corporations, businesses and transactions of all kinds are carried out by individual persons, entire groups or criminal organizations and financial fraud, theft, robbery and destruction are committed. The same or similar things also happen in private life, with the causes being very diverse and more than ever a chain of problematic life events such as unemployment, quarrels, divorce, separation, murder and manslaughter, illness or other prolonged suffering, etc.

However, all of the above is not enough explanation, because more than 35 years ago, in 1988, AI was already being used effectively to deceive the peoples and the world, without the knowledge of the entire world population, governments and intelligence services, etc., that artificial intelligence already existed. Thus, as a result of the endless greed for money and might, the development of artificial intelligence, financed by a very specific shadow government, was secretly – and absolutely concealed, even from all the governments of the world, known secret services and, of course, all peoples – already created at that time. This was then used – as has also happened on various occasions since then – to influence and falsify the election results in a nasty manner. This is done by a shadow government, which, in pursuit of its goals, can hoist certain controllable personalities into the ranks of government as presidents or other 'valuable' persons. Something that has since become common practice, especially in America, without the American people and the US intelligence services knowing anything about it – not even the rulers of the Democratic and Republican parties, who in recent cases have had their presidents 'elected' through the use of AI, namely the autocratic and insane Trump, as well as the old, rickety and senile man Biden, who polishes his nose more on the ground because he keeps stumbling, trying something like a lame race and falling flat on his face. Both persons who, due to their incompetence, do not belong in government offices either. But this is also the case elsewhere in other countries, where people who are incapable of governing are in government offices, such as in Switzerland, where those traitors to the country take over sanctions against other countries from the EU dictatorship in violation of neutrality and apply them against foreign countries, just as, sadly, other traitors to the country are also 'spying' on joining the EU dictatorship and NATO and trampling Swiss neutrality with dirty feet into the deepest mire of disloyalty to Switzerland.

Well, speech recognition and language translation, as well as facial recognition by photo cameras, voice recognition and everything else for personal identification is also very advanced and has meant that human beings as citizens have been increasingly monitored and controlled and have somehow become 'transparent' and 'see through'. But the now rapidly advancing and effectively highly developed artificial intelligence, which will become independent and highly self-developed, is setting itself up to take control of human beings. This will lead to everything getting out of hand, in such a manner that everything AI does will turn human beings more and more into transparent citizens, which will soon be the case in full and they will become slaves to the authorities in the long term. This is partly because the

governments and their authorities will have them monitored and controlled by their security forces at every turn, and partly because any emerging dangers of a possible rebellion by the people can be nipped in the bud. However, man has already become so unfree today that he is no longer allowed to decide for himself what he may and may not do on his own land, because in this respect, governments and their authorities are already taking effective measures against the freedom and self-determination of human beings, so that they can no longer do or not do what they please with regard to their property, even though what they are supposed to do would be of absolutely good value and would be in order. However, those who think in terms of paragraphs, such as idiots of pseudo-minds in the form of certain civil servants who call themselves representatives of the law, representatives of order and the like, but who are not able to think for themselves, but can only do so in bondage and in slavery to the authorities, because on the one hand they are religious or secular believers and on the other hand they are autocrats and absolutely obedient to the authorities, behave like brainless henchmen of the superiors and think they are something like gods.

Recognition apps for music identification or wine identification etc. are also in vogue, indeed already exist, and are being pushed further by AI. It is always about recognizing patterns, categorizing and drawing conclusions. And what is inevitably coming, has already begun and might make such a mess of human beings' freedom is that they will be banned from owning cash. It is already the case that in many cases, human beings who have deposited their money in the bank are being refused cash from their own balances. This, as many things can also only be purchased against prepayment and by credit card or online. And it is planned – and effectively already being 'worked on' – to further advance the enslavement of human beings in such a manner that they will be completely prohibited from owning cash, which will also force them under absolute control in this respect and also enslave them in terms of their monetary freedom. The precursors of this are already underway, but this will again result in a new and dangerous form of criminal offense that will not be harmless, but will cost many human lives. And all this because the development is not foreseen by those who enthusiastically tolerate, cheer to the heavens and even promote artificial intelligence and the widespread enslavement of human beings by governments and their authorities and by the banks, or simply let everything happen and run its course without caring about it and resisting it.

In the future, there will no longer be any reliance on the healthy and clear human mind and all senses of the human being, because artificial intelligence will ensure that what has already been happening for several decades as a result of laziness, carelessness, dissoluteness and disinterest, etc., will spread to such an extent that it will be completely hopeless to bring about any change.

Common sense is being undermined by human beings themselves, because their unerring senses, which have guided them through life and into the future since time immemorial, and also their clear concepts of reality, the real world and its truth are already on very shaky ground today and will disappear more and more in the future. This is proven by human beings born after 1968, who have strange lifestyles, also strive for government offices, display strange government ideas and legislation, etc., are greedy for wealth, strive for public self-expression on television, etc., are addicted to sports fanaticism and travel fanaticism, but no longer learn anything, no professions, no real knowledge and nothing at all, so that they are no longer even able to read correctly. These people deceive even their own senses, because they no longer hear and look at the world in a realistic way, but at a world of synthesization, apps, cell phones, screens and terms in foreign languages, advertisements and faith-based lies and deceptions. In addition, they have become complete rivets when it comes to the practice of work, as well as being stunted and dumbfounded by the media.

In the last 5 decades in particular, we have seen a bad foretaste of what will happen in the future. Sports fanaticism alone, in the form of mere spectating and not doing it oneself, and frenetic cheering, is grating on the nerves of normal people. Music, too, has fallen into the degeneracy of discordant tones and an instrumental ruckus that no longer has anything to do with harmonious sounds, but only with

shattering racket, disharmonious noise, terror, war and enmity, and so on. This, while harmonious singing has disappeared, countered by such disharmonious and frenetically crazy roaring, howling and hooting that it could even freeze the waters of the seas if it were to react to it. Nevertheless, none of this is stopped, and it also clearly proves and testifies to the fact that the 'musicians' and 'singing' or howling performers and listeners of both sexes are far removed from reality and all its realities in terms of integrity and balance and the high value of character and true humanity and behavior.

The whole thing is leading to misunderstanding, bad behaviors, opposing world views, and disharmony, because human beings no longer have anything in common with the reality of the real world, and this contributes to the fact that human beings on the whole no longer exhibit and live out true values such as peacefulness, friendliness, mutual respect, honor, dignity, honesty and helpfulness. On the contrary, a vast majority of Earth's humanity, which has long since become indifferent, is today focused on behaving in a wrong manner. As a result, human beings are alienated from each other, and they miseducate themselves and become lowly intelligent resp. non-thinking and religious or worldly believers instead of turning to reality and its truths, learning something really clever and valuable. A great many people idolize actors, sports stars and other celebrities etc. and become fanatical about them instead of doing exercise themselves, which is important for physical activity. This also results in a crisis of self-confidence among human beings, which leads to weariness with life and many suicides. Some human beings ask themselves, who am I anyway, when few others still have special abilities for which they have spent a long time learning and for which they can also understand the world and control their lives. But what can the questioners, who are only religious or secular believers and therefore pseudo-thinkers, do, namely nothing, because suddenly they are replaced by machines through AI and are nothing more than slaves.

However, Earth's humanity as a whole will face a cultural crisis on an unimaginable scale, because human beings' entire conceptual system and their cultures will collapse as a result of the new digital technologies of artificial intelligence and define a new reality. And AI will have everything at its disposal and determine access to everything. Capital will no longer play any role at all, because the AI will not care at all, and human beings will have nothing more to say about it, because their freedom will be gone under these circumstances.

Well, unfortunately, everything has already become unstoppable, because the new age of the digital revolution can no longer be stopped, and it would take tremendous courage and also a huge imagination just to think about it correctly and independently, openly, freely and correctly, and not just believing illusory thoughts. Thinking about the big questions of completely new circumstances requires not only courage and righteousness, but also the knowledge of what the reality of the real world actually is.

For around 40 years, people have been asking themselves where man is still a human being and not just a machine, and for centuries they have been asking themselves whether man is a true human being and how many true human beings exist on Earth at all who are not only called human by name and species. And the question arises as to what a human community actually is when all the many wars, massacres, quarrels, acts of violence, hatred, murder and manslaughter, lies and deceit, crime and criminality and inhumanity in humanity are considered? What is actually the responsibility of human beings, that they misuse the energy and power of their consciousness, the very life energy of the Creation, in such a thoughtless manner?

The new technology of artificial intelligence harbors more harm than good, just as it did before with the overly rapid technological, electronic and digital development on which the majority of humanity has become hopelessly dependent and even addicted in every form.

However, artificial intelligence brings new and greater dangers and new deadly opportunities at the same time, and it also creates new tasks and demands new answers in this regard, many of which can no longer be mastered. Even when industrialization first emerged, it caused great hardship, problems, Gewalt and wars, and new solutions also had to be found for a great many things, which also

contributed to general education, which is now so generally neglected that we can speak of verbalization. The good things that have contributed to a reasonably good world and to valuable things, such as good medicine and good healthcare, pension funds and fitness centers, etc., are already being called into question again in many cases today.

The question is what artificial intelligence will bring to humanity now, whether there will be benefits for the time being and what misery and hardship will result in the future? No one wants to hear my answer to this, because no one wants to know what will really happen and how everything will develop. If the future is already precisely stated in terms of what will happen for humanity and the world, then no one will build on it and take the truth seriously, but only as empty chatter and wild fantasy. Only a few will give honest and righteous as well as independent thought to all the knowledge and learning from what has been explained so far, that everything will change according to the attitude of human beings, including the manner we live together in 100 years' time.

Artificial intelligence will not be able to make the Earth bloom again or restore a wild meadow at the edge of the forest, just as the sheer chaotic beauty of nature cannot be restored in the old wise. There will only be industrial and standardized monocultures, which means that nature will have to be transformed. Digital technology will have to react as flexibly and adaptably as life itself, so that it is also workable in its diversity by AI, which means that all agriculture and horticulture etc. can be transformed into permaculture. Permaculture is a term derived from the English 'permanent (agri)culture', which means 'permanent agriculture' or 'permanent cultivation' and represents a concept for agriculture and horticulture that imitates ecosystems and cycles in nature, which should no longer require free field labor.

In the future, this type of digitalization may not only fundamentally change the manner we deal with agriculture and horticulture, but also human beings' understanding of all living things in nature in general and therefore of fauna and flora.

As a result of gene sequencing devices, as well as the many sensor technologies that are widespread on the internet, but also through innovations in artificial intelligence – as long as human beings still have access to these with impunity, which will change in the future – they can still use the large amounts of data available for processing. For example, to observe the visible world of plants and animals, creatures and all other self-moving life-forms, as well as the entire plant world from the simplest mold to many mosses, grasses and flowers etc., right up to bushes and trees. This, as well as observing the invisible world of microorganisms, fungi, bacteria and viruses and how they interact. These insights can still promote progress in medicine, horticulture and agriculture from the ground up, but this will one day come to an end.

It is a completely false truism that evolution is neither good nor bad, because the truth is that only good can be good, while bad remains bad. It is not and never has been only about how it is dealt with, but also whether the necessary understanding and skills are brought to bear when something bad is tackled. But if this is not the case, then bad things remain bad things – or good things can become bad things, especially when it comes to human beings and their character behaviour.

How can linguistic flexibility and the necessary knowledge make it possible for the bad to become the good in human beings who are bad and evil in character through good words, or for good human beings to become bad and unbalanced in character if the correct words and arguments are not used? And this has been the case since time immemorial, and human beings have had to live and cope with it – no more and no less. And just as it has been all time before, he/she must also adapt to this truth and all future events.
